527, 558

Matriz: gray brown soil with large limestone
inclusions

Concentraciones de Artefactos: Human bone at the base of
level 03

Notas: at the base of L3, we ran into
a mass of human bone that was
well preserved, but disarticulated. Unfortunately,
while we were excavating 527, 557, I
thought the bone was part of L3 because
it lay at the base of the large rock
formation L3. In 527, 557, we excavated
a little deep, therefore this artifact
has yet to be analyzed since there
shall have been part of L-4. I
have decided that we will not
excavate 526, 556 and 526, 557, but
we will excavate 527, 558 and
527, 559.

Note that L3 in 527, 559 terminated
with a light tan brown soil which I do not
remember finding in 527, 557 - it is
possible that the real L3 has a little
slope in 527, 559, but well see
later. We called the material under
L3 in 527, 559 "L3b"

Note that 527, 558 should have
had a level 3b, but someone
excavated a little too deep.

Those that have followed the
excavation of L3 are probably accurate. (See notes)

the full axis points. I see two possibilities. First of all it could be full used to cover up the bones (if flesh) deposited in L4. Second, it could be, collapse / naturally eroded a little. But probably at some point it could be true. It presently appears

that L3 in SS27, SS6, SS7, and part of SS27, SS8 was actually full of what may have been a hole excavated into previously deposited

strata L3 & L3b of units SS27, SS9 and

Op 1000 Profile of the SS27N Line

SS27, S60. Of course we need to wait for the final profile, but I am fairly certain of this observation. Once all of SS27, SS9 is excavated, all should be revealed. This is good news because it is possible that SS7, SS8 may not contain as much skeletal material as SS27, SS7 (which contained a lot). See my notebook notes for the excavate of L3b & L3c.

7/25/97

Now the above sketch is wrong. We encountered hum bone in both SS27, SS8 and SS27, SS9. It lay a little deeper & was thinner (i.e. there was not a lot of it).

del centro del Hoyo

Matriz: Humus

Concentraciones de Artefactos: _____

Notas:

el datum de la estructura
1000 esta a 2mt del datum de la
Str. 606.

En el pozo 525, 561 se encontraron
huesos grandes y fragmentos de huesos que parecen
pertener a un animal, pero no está
definido aun.

En el pozo 525, 561 se encontraron
fragmentos de huesos que parecen
pertener a un animal, pero no está
definido aun.

Un diente y fragmentos de hueso
fueron hallados en el pozo 529, 561,
pero no se sabe si son de hombre o animal

También en el pozo 525, 561 fue
hallada una pieza de cerámica, la cual da
la idea que los huesos pertenecen a un animal

606, S.E. del muro

Matriz: colapso - trazo marroquin con pedras
de vauca Imovables

Concentraciones de Artefactos: worked bone / carbon

Notas: There were small pieces of
worked bone in 526, 560 and 527, 560.
Note that 527, 561 will not be excavated
as it contains no more.

In 525, 561 the 1st tier of the
west wall of the platform
looked like 30 cm to the east. There
was a lot of carbon in this area
It is possible that south of the 606
was found here. We also found
small pieces of worked bone in 527, 560
and 526, 560 - they seem to be part of
a single artifact.

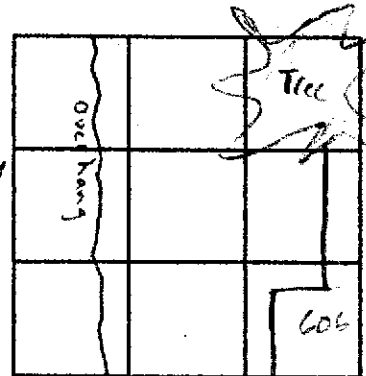

We excavated until height in 527, 560
and 526, 560. We could have been the
same in the 525 units. 527, 561 was
not excavated (big tree there). 526, 561
but the wall of the 1st tier of the platform
of St. 606 which had a possible niche
with a plaster floor. In the 529E
unit the bedrock had a slope. We
excavated only the superficial collapse
from 525, 529. It happened under
level 03 (a grey soil with limestone
material) in 527, 529 and 526, 529.
